

## Review Arlo

### Arlo Technologies, Inc

Keep your house protected with the cameras of this security company. With the Arlo application, you will have total control of all recording devices and you can configure it to get even more out of it with its multiple functionalities such as configuring your motion detector or your uninterrupted recording

Keep your home protected with security cameras and have everything under control with the **Arlo app**. It is one of the leading companies when it comes to defending a smart home, being the creator of the first 4K UHD security camera, its recording devices are the most used and each year they improve their performance with each new update.

To have full control of your cameras, **download the Arlo app for free**. You find it available for **Android** and **iOS** devices and with it you can have all your devices connected and it facilitates the connection of those that are most important.

But not only does it allow you to see what is happening in your house, with it you will also have a lot of functions that you will find very useful. From the Arlo application you can see live video of what is happening, play the clips that have been recorded, activate and deactivate the security system and not miss anything.

To start using it, you only have to download its latest available version, you have to take into account which model of cameras you have installed and configure it for each of them, that is why it is important to always have your latest model and start using it, like this easy. If you do not have automatic updates indicated, the app will indicate this reason and recommend that you do so, even to not let you access your account through it. Having it well restored is essential to ensure that the entire transmission goes smoothly, so that you remain as safe as possible and there are no errors.

**Download Arlo**, with its new design it will make it even easier for you to control all your devices. With a very minimalist interface, your system administration system that you have at home will be at levels that have never been seen. Once you have it on your mobile device, it is essential that you configure it correctly, indicating the geolocation and, above all, enabling facial and fingerprint authentication.

You can activate notifications on your device when you need it, this function means that instead of being sent from your account when anything happens, you can configure each of them according to the criteria you want. You make the rules.

To reproduce the images that the cameras have recorded, you just have to look in the Arlo app menu for the Live button, which will allow you to see in streaming what is happening and choose the one you want to see. Below each of the thumbnails there is a time stamp in which you will see if any of them is disconnected and see when each of the images occurred.

With this **free application** you can also manage motion and sound detection for each of the cameras. If the icons appear in strong color it will indicate that it is activated, while if it appears in soft tones you will know that the system is off. If the color is amber it is because it is detecting some movement at that moment. This all depends on the model you have.

Arlo has a library in the cloud where all the images they capture will be saved, which you can view without leaving the app itself and you will find them easily tagged by device name and date.

Program the operation of each of the recording devices you have, you will only have to activate the time interval that you want it to function from the application and simply relax. You can do it for several days, without having to do it manually every day and you can modify it as many times as you want.

**Arlo** cameras record everything continuously, without interruptions, and keeping a complete video log, managing all this data is very difficult. To help you, the app has a very useful timeline that will allow you to choose the exact moment in the timeline and quickly find the exact date and time of what you want to see, configure the videos according to a color coding with which to classify and adjust them the time intervals according to the portion of video you need, this can be 24 hours, 1 hour or 5 minutes.

Pros	Cons
<ul style="list-style-type: none"><li>- You have control on all cameras.</li><li>- You can configure your own alerts.</li><li>- You can see live what they are recording.</li><li>- Recorded videos are saved in the cloud.</li></ul>	<ul style="list-style-type: none"><li>- Searching your library is difficult.</li><li>- Rating of videos can be confusing.</li><li>- Motion detector alarms can be for nothing.</li><li>- Constant updates are very heavy.</li></ul>
