Photo Grid is a photo collage and video editor app that you need for photography fans and Instagram users!

Photo Grid is one of the most interesting and differentiated applications of the playstore, bringing to the practicality of your mobile a simple and efficient image editing tool, perfect for those who do not want all the complexity of professional editors, but do not want to stop do. your favorite montages.

Photo Grid is an application that brings a very old and classic trend to the digital world: photo collage. Whether they are murals with stripped-down visuals or more organized collages, the important thing is to gather important images for your life and for the lives of those around you so that they form a collage panel. And you don't even need to have a super cell phone, a simpler model such as the galaxy j1 is enough.

Extremely simple and easy to use, the Photo grid makes this panel very simple to do, without the need for knowledge in professional image editing programs. In addition, the application still allows montages to be saved for publication on the most diverse social media, such as Instagram and Facebook.

The main advantage of **Photo Grid** is ease. It is very similar to sandbox environments, whether from games or other Apps that use this type of aesthetics and interaction. With simple and intuitive controls, it gives you the opportunity to make montages more freely or even use frames to place them in a more organized way, creating different experiences. Another fun tool is the stickers, which were also an old trend that wins a renewal in this application.

Above all, it is important to say that it actually does more collages than actual image edits. **Photo Grid** will not be able to enhance or change color schemes in a finer way, working with, at most, filters similar to those of Instagram.

Also, the montages do not involve all the cuts that would be interesting, since the issue is more positioning of the photo as it is, needing to use superposition than a legitimate cut. However, the Photo Grid fulfills its main role of assembling efficiently and easily, without major difficulties, being ideal for lay people who need something practical and light on the mobile.

We take many photos every day and we always want to give it a special, important, fun touch, add a filter and many more effects to make this a very good photo.

As we have talked about when **Downloading Photo Grid for free** we find that it is a very complete application that has everything and is very easy to use. The good thing is that it will help you edit the photos in a very professional way, it has many tools with which you can improve your photos, your selfies and all the photos that you think are convenient.

When we just opened the **Photo Grid application**, we found outstanding photos of some users who are from Photo grid since they also have a social network and you can create an account by linking your facebook or other social networks such as Google +. The application is something like Instagram but not so famous what makes it famous is that you can edit with a quality and with a very good professionalism to share on your social networks, that is the plus

that Photo grid has.

Within the application if we click on + we will be able to see the different categories it has to make collage, edit a photo individually, the twinkle that is a plus that the application is giving it is a prism type effect that you can do, it They can make presentations with photos, a free style to edit photos freely, add a poster or some stickers to the photos and they can also share it immediately if they have an account.

You can make a strip of images so let's start from what the collage is so you can see how the application is used. We are going to choose for example we can make a collage here of food, we click on it next and we will be able to see below on the screen the parameters and the tools that are used for each category to take the individual photos, to make the videos, to make the strip of images, it is exactly the same only change the format of the shape of the photos. We can echo the collage design and it will show us different shapes, in other positions with which we can make the collage and introduce our images.

Once we choose the template that works best for us to make the collage, we simply click on add images, we choose the ones we like, we click on the next one and then finish, thus remaining saved.
